## BESSINE

## PURPOSE

Compute the exponentially scaled modified Bessel function of order v where v is a non-negative real number.

## DESCRIPTION

This function is defined to be:

$$
\begin{equation*}
\operatorname{BESSINE}(x)=e^{-x} \mathrm{I}_{v}(x) \tag{EQAux-33}
\end{equation*}
$$

where $I_{v}(x)$ is the modified Bessel function of order $v$. See the documentation for the BESSIN command for a description of this function.

## SYNTAX

LET <y2> = BESSINE (<y1>, <v>)
<SUBSET/EXCEPT/FOR qualification>
where $\langle\mathrm{y} 1>$ is a non-negative number, variable or parameter;
<y2> is a variable or a parameter (depending on what <y1> is) where the computed Bessel value is stored; $\langle\mathrm{v}\rangle$ is a non-negative number, variable, or parameter that specifies the order of the Bessel function;
and where the <SUBSET/EXCEPT/FOR qualification> is optional.

## EXAMPLES

$\operatorname{LET}$ X2 $=\operatorname{BESSINE}(2,2)$
LET $Y=\operatorname{BESSINE}(X, 3)$

## NOTE

DATAPLOT uses the routine BESIE from the SLATEC Common Mathematical Library to compute this function. SLATEC is a large set of high quality, portable, public domain Fortran routines for various mathematical capabilities maintained by seven federal laboratories.

## DEFAULT

None

## SYNONYMS

None

## RELATED COMMANDS

BESSI0 $=\quad$ Compute the modified Bessel function of order 0.
BESSI1 $=\quad$ Compute the modified Bessel function of order 1.
BESSIN $\quad=\quad$ Compute the modified Bessel function of order N.
BESSJN $=\quad$ Compute the Bessel function of the first kind and order N .
BESSIN $\quad=\quad$ Compute the modified Bessel function of order N .
BESSKN $\quad=\quad$ Compute the modified Bessel function of the third kind and order N.
