## BESSY1

## PURPOSE

Compute the Bessel function of the second kind and order 1.

## DESCRIPTION

The definition of Bessel functions of the second kind with order v ( v is a non-negative real number) is:

$$
\begin{equation*}
\mathrm{Y}_{v}(x)=\frac{\mathrm{J}_{v}(x) \cos (\pi v)-\mathrm{J}_{-v}(x)}{\sin (\pi v)} \tag{EQAux-43}
\end{equation*}
$$

where $\mathrm{J}_{\mathrm{v}}$ is the Bessel function of the first kind. See the documentation for the BESSJN commands for details on this function.

## SYNTAX

LET <y2> = BESSY1 (<y1>) <SUBSET/EXCEPT/FOR qualification>
where $\langle y 1\rangle$ is a positive decimal number, variable or parameter;
<y2> is a variable or a parameter (depending on what <y1> is) where the computed Bessel value is stored; and where the <SUBSET/EXCEPT/FOR qualification> is optional.

## EXAMPLES

LET X2 = BESSY1(2)
LET Y = BESSY1 (X1)

## NOTE

DATAPLOT uses the routine BESY1 from the SLATEC Common Mathematical Library to compute this function. SLATEC is a large set of high quality, portable, public domain Fortran routines for various mathematical capabilities maintained by seven federal laboratories.

## DEFAULT

None

## SYNONYMS

None
RELATED COMMANDS
BESSY0 $=\quad$ Compute the Bessel function of the second kind and order 0 .
BESSYN $\quad=\quad$ Compute the Bessel function of the second kind and order N . BESSJ1 $\quad=\quad$ Compute the Bessel function of the first kind of order 1. BESSI1 $=\quad$ Compute the modified Bessel function of order 1. BESSK1 $=\quad$ Compute the modified Bessel function of the third kind and order 1.
